## The Oklahoma Cooperative Extension Service Bringing the University to You!

The Cooperative Extension Service is the largest, most successful informal educational organization in the world. It is a nationwide system funded and guided by a partnership of federal, state, and local governments that delivers information to help people help themselves through the land-grant university system.

Extension carries out programs in the broad categories of agriculture, natural resources and environment; family and consumer sciences; 4-H and other youth; and community resource development. Extension staff members live and work among the people they serve to help stimulate and educate Americans to plan ahead and cope with their problems.

Some characteristics of the Cooperative Extension system are:

- The federal, state, and local governments cooperatively share in its financial support and program direction.
- It is administered by the land-grant university as designated by the state legislature through an Extension director.
- Extension programs are nonpolitical, objective, and research-based information.

- It provides practical, problem-oriented education for people of all ages. It is designated to take the knowledge of the university to those persons who do not or cannot participate in the formal classroom instruction of the university.
- It utilizes research from university, government, and other sources to help people make their own decisions.
- More than a million volunteers help multiply the impact of the Extension professional staff.
- It dispenses no funds to the public.
- It is not a regulatory agency, but it does inform people of regulations and of their options in meeting them.
- Local programs are developed and carried out in full recognition of national problems and goals.
- The Extension staff educates people through personal contacts, meetings, demonstrations, and the mass media.
- Extension has the built-in flexibility to adjust its programs and subject matter to meet new needs. Activities shift from year to year as citizen groups and Extension workers close to the problems advise changes.

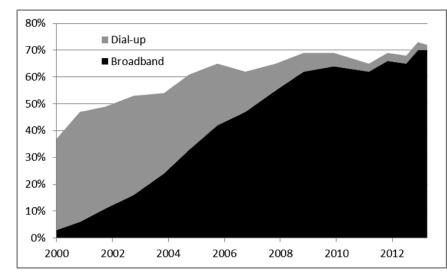

# Broadband Infrastructure and Adoption in Oklahoma – 2015 Edition

Brian Whitacre Associate Professor and Extension Economist

#### Introduction

Broadband or high-speed Internet access has become Rates of residential broadband adoption increased draan increasingly important part of the lives of most Americans. matically during 2000 to 2014 for the nation as a whole. Figure This current report uses the latest available data to assess how 1 shows that the U.S. rate of household broadband adoption broadband infrastructure and adoption is progressing across was around 70 percent in 2014, with another 2 percent still Oklahoma, and how the state compares to its neighbors and using dial-up. This leaves slightly less than 30 percent of all the nation as a whole. households with no type of Internet connection at home. For Historically, broadband access has been defined as at least this report, the term 'adoption' refers to a household actually 200 kilobytes per second (kbps) of data transfer in at least one subscribing to a monthly broadband connection, while 'access' direction. However, the Federal Communications Commission denotes that broadband is available where the household is located. has updated that definition on more than one occasion, with

Historically, broadband access has been defined as at least 200 kilobytes per second (kbps) of data transfer in at least one direction. However, the Federal Communications Commission has updated that definition on more than one occasion, with the current definition (as of 2015) being 25 megabytes per second (mbps) download and 3 mbps upload. This is more than 100 times faster than the historical 200 kbps definition. Unless noted otherwise, this document will use the original definition of 200 kbps to define broadband, since most of the data collected on this topic still uses that threshold. His report, the term 'adoption' refers to a household actually subscribing to a monthly broadband connection, while 'access' denotes that broadband is available where the household is located. In Oklahoma, the rate of residential broadband adoption was 68 percent in 2013, mirroring the national rate that year. However, this masks a significant "digital divide" between rural and urban parts of the state, with 72 percent of urban households having a broadband connection, compared to only 48 percent of rural households (ESA and NTIA, 2014). Figure 2 displays rural/urban broadband adoption rates for Oklahoma

Oklahoma State University, in compliance with Title VI and VII of the Civil Rights Act of 1964, Executive Order 11246 as amended, and Title IX of the Education Amendments of 1972 (Higher Education Act), the Americans with Disabilities Act of 1990, and other federal and state laws and regulations, does not discriminate on the basis of race, color, national origin, genetic information, sex, age, sexual orientation, gender identity, religion, disability, or status as a veteran, in any of its policies, practices or procedures. This provision includes, but is not limited to admissions, employment, financial aid, and educational services. The Director of Equal Opportunity, 408 Whitehurst, OSU, Stillwater, OK 74078-1035; Phone 405-744-5371; email: eeo@okstate.edu has been designated to handle inquiries regarding non-discrimination policies: Director of Equal Opportunity. Any person (student, faculty, or statf) who believes that discriminatory practices have been engaged in based on gender may discuss his or her concerns and file informal or formal complaints of possible violations of Title IX with OSU's Title IX Coordinator 405-744-9154.

Issued in furtherance of Cooperative Extension work, acts of May 8 and June 30, 1914, in cooperation with the U.S. Department of Agriculture, Director of Oklahoma Cooperative Extension Service, Oklahoma State University, Stillwater, Oklahoma. This publication is printed and issued by Oklahoma State University as authorized by the Vice President, Dean, and Director of the Division of Agricultural Sciences and Natural Resources and has been prepared and distributed at a cost of 84 cents per copy. Revised 0715. GH.

and some neighboring states in 2013. In this instance, rural refers to non-metropolitan areas, which are areas not containing a metropolitan or micropolitan statistical area and have at least 10,000 people. The rural/urban broadband adoption gap of 24 percentage points in Oklahoma is the largest among the states shown. The low rates of broadband adoption in rural Oklahoma are cause for concern, given recent research showing rural areas with high broadband adoption rates have higher growth in income levels, more firms and employment, and lower growth in unemployment rates (Whitacre et al., 2014a; 2014b).

Recently, estimates of broadband adoption at the county and census tract level have become available. Figure 3 shows household broadband adoption rates in Oklahoma at the census tract level in 2013. It is clear that the southeastern part of the state lags behind in terms of broadband adoption, with rates typically less than 40 percent. On the other hand, many of the tracts surrounding the major metropolitan areas in the state (Oklahoma City, Tulsa and Lawton) are extremely high, with many having household adoption rates of more than 80 percent. Some relatively rural parts of the state demonstrate very high levels of broadband adoption, such as Boise City, Durant, Cordell and Alva.

These trends continue when we turn to a county-level map also showing the metropolitan counties in the state. While the counties nearest OKC, Tulsa and Lawton all rank relatively highly, two of the three counties with the highest rates in the state are actually found in non-metropolitan counties: Woods and Cimarron. The rates in the southeastern part of Oklahoma are still noticeably lower than the rest of the state.

#### Summary

Oklahoma's household broadband adoption rate in 201 was similar to the nation as a whole, however, the rural/urba gap of more than 20 percentage points is among the highest in the nation. There are clear discrepancies across the stat in terms of broadband adoption rates, with households in th southeast typically displaying some of the lowest in the state While overall access to "basic" (3 mbps download) broadban speeds is good across the state, fewer than half of the state population in towns of less than 10,000 residents have access to the new FCC definition of broadband (25 mbps download The past five years has seen dramatic growth in smartphon use, but most broadband users continue to have a wired cor nection as well. Finally, most households that have chosen no to adopt do not see the need for broadband, suggesting that efforts to increase future adoption rates will have to address this demand-side issue.

### **Broadband Infrastructure**

One potential reason why certain areas of the state lag behind in terms of broadband adoption might be that there are few broadband providers in their area. However, Figure 5 demonstrates there is not a large correlation between the number of fixed (wired, as opposed to wireless) broadband providers in a county and the broadband adoption rate in that county. Several counties have relatively high adoption rates despite having only a small number of providers (Woodward and Cimarron, for example). Conversely, many counties have low adoption rates in spite of having a large number of broadband providers (Creek and Pittsburg, for example).

477 Data, available at http://transition.fcc.gov/wcb/iatd/comp.html

Figure 4. County-level Residential Broadband Adoption Rates in Oklahoma, 2013. Source: FCC Form 477 Data, available

In 2010, the National Broadband Map (NBM) became the first official national source of data to specifically detail where broadband infrastructure was and was not available. The NBM summarizes the percentage of the population with access to broadband of different types and speeds. This information is available at both the city and county level.

The NBM data makes clear that many Oklahomans do not have access to speeds that officially qualify as broadband under the 2014 FCC definition (25 mbps down, 3 mbps up). Of Oklahoma's 77 counties, 71 have more than 99 percent of their residents with access to broadband with download speeds of 3 mbps (top map of Figure 6). However, the percentage of

Figure 5. County-level Broadband Adoption Rates and Number of Wired Broadband Providers, 2013. Source: FCC Form

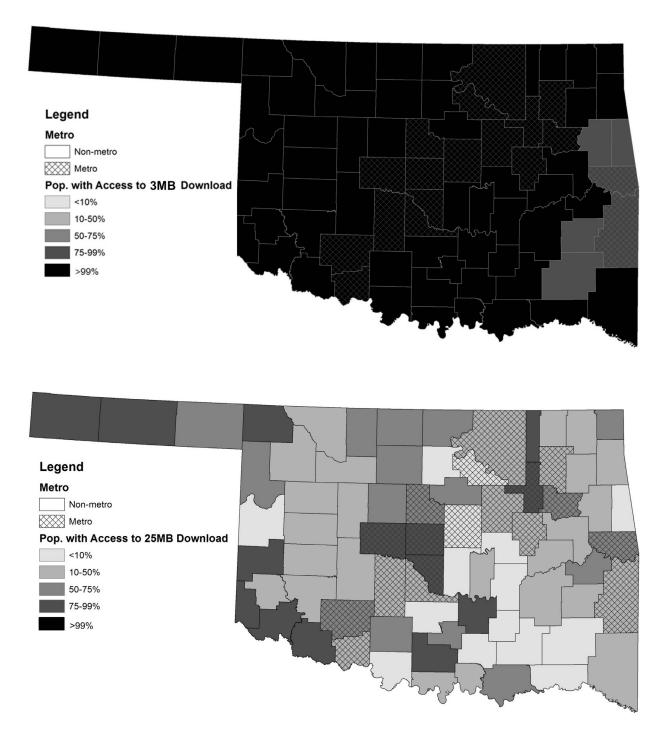

Figure 6. Percentage of County Population with Access to 3 mbps (top) and 25 mbps (bottom) Download Speeds, 2014. Source: National Broadband Map Data, available at http://www.broadbandmap.gov/data-download

residents with access to the higher speed of 25 mbps are dramatically lower (Figure 6, lower map). Fifteen counties have less than 10 percent of their population with this type of access.

Turning to the city-level NBM data, it becomes increasingly clear that rural Oklahoma lags behind in terms of high-speed broadband infrastructure. This is displayed in Table 1, which classifies Oklahoma cities by size and lists the broadband availability situation for residents of those cities. For the smallest cities (less than 2,500 residents - thus, officially "rural"), 81.3 percent has access to relatively slow wired broadband (200 kbps), while almost all (99.7 percent) have access to relatively slow wireless broadband (200 kbps). Interestingly, wireless (i.e. cellphone) connections up to 10 mbps cover all residents of cities of more than 10,000 residents, and even more than 90 percent of smaller town residents. These types of connections do not provide access to 25 mbps download speeds, however. Table 1 shows that larger cities have a dramatic advantage in terms of access to 25 mbps broadband, with 96 percent of citizens in towns of more than 50,000 having this type of broadband available, compared with only 32 percent of towns with less than 2,500 residents.

Figure 7 displays the growth in lines per capita for different One striking change that has occurred in recent broadtypes of broadband technology during the period 2004 to 2014. band reports is the rapid increase in households reporting to These charts show that, in terms of total broadband lines per have a mobile wireless connection to the Internet. Figure 9 capita, Oklahoma has seen similar trends as those displayed demonstrates this trend. While growth in fixed (wired) connecby most of its neighbors and the nation. It is worth noting that tions only increased from 80 million total lines to 96 million the number of broadband lines per capita is quickly approachtotal lines between 2009 and 2013 (a 20 percent increase), ing one - meaning that everyone would have a broadband wireless connections increased from 56 million to 197 million connection. However, as the other figures show, most forms (a 250 percent increase). Thus, wireless broadband connecof wired broadband (cable and Digital Subscriber Lines, or tions now dramatically outnumber the total amount of fixed DSL) have effectively leveled off, with the continuing growth connections. Nearly 2/3 (64 percent) of all Americans own a being due to increases in mobile Internet (i.e. smartphones). smartphone as of 2014 (Smith and Page, 2015). For the vast Interestingly, in the most technologically advanced category, majority of households, these mobile connections are an ad-Fiber to the Home (speeds of 100 mbps or more), Oklahoma dition to a household's broadband portfolio. In fact, only 10 has seen very little growth when compared to some of its neighbors and the national average. There are some notable percent of smartphone users had no broadband service at home other than their smartphone data plan in 2014 (Smith exceptions, however – the town of Sallisaw, OK was an early and Page, 2015). Thus, while the growth in mobile wireless adopter of Fiber to the Home technology back in 2005 (refer is impressive, its significance to the total broadband adoption to Oklahoma Cooperative Extension Fact Sheet AGEC-1000 picture is limited. for more details on their story).

## **Broadband Costs**

While Oklahoma-specific costs of broadband access are not readily available, Horrigan (2010) reports a national average monthly cost of \$41, although those that "bundle" Internet with other services pay only \$38. Stand-alone broadband service was estimated to cost \$46 monthly.

## **Reasons for Non-adoption**

Some surveys have specifically asked respondents why they do not adopt broadband access at home. Figure 8 summarizes the results given by non-adopting households across the nation in 2012. The primary reason cited was a lack of need or interest, followed by both the cost of service and the lack of an adequate computer. The percentage of households citing "not available" is minimal; this corresponds to the high levels of basic (i.e. 3 mbps) availability depicted in the National Broadband Map. Whitacre et al. (2015) find similar patterns in exploring reasons for the rural – urban broadband divide, and suggest that future policies to increase adoption should be more demand-oriented (as opposed to infrastructure-oriented).
